CHAPTER I

INTRODUCTION

1.1 Overview

The level and distribution of poverty in Ethiopia is declining from time to time and a remarkable economic growth has been observed. In particular, Ethiopian has registered two digits growth rates continuously in the last **15** years. According to the results obtained from the 1999/00 Household Income, Consumption and Expenditure Survey and Welfare Monitoring Survey of the Central Statistical Agency (CSA), 44 percent of the total populations (45 percent in rural areas and 37 percent in urban areas) were found to be below poverty line, furthermore, the 2004/05 surveys showed that 39 percent of the total population were under the poverty line out of which 39 percent in rural areas and 35 percent in urban areas. While the 2010/11 report reveals that 29 percent of the total population were under the poverty line out of which 30 percent in rural areas and 25 percent in urban areas. The latest interim report on poverty analysis study prepared by National Planning Commission (NPC) using the 2015/16 HCES data, explains 23 percent of the population were under the poverty line out of which 25 percent reside in rural areas and around 14 percent in urban areas.

The country together with development partners has put poverty reduction strategies high on the agenda and working firmly on the implementation program over the past two decades. The government accordingly coordinated the design and implementation of the Sustainable Development and Poverty Reduction Program (SDPRP) from year 2002/03 to 2004/05 and a Plan for Accelerated and Sustained Development to the End Poverty (PASDEP) from the year 2005/06 to 2009/10. On the bases of experience gained, the council of ministers and the House of People's Representatives have adopted the Growth and Transformation Plan (GTP1 & GTP2) as the national planning documents of the country for the period 2010/11 to 2019/20. Moreover, the current HCES and WMS surveys also used as a springboard for monitoring and evaluation of the five years growth and transformation plan two (GTP2) of Ethiopia.

In light of the plan to reduce poverty over time, strong system of monitoring and evaluation has also been put in place. Consequently, the issue of welfare monitoring in Ethiopia arose as part of

the Economic Reform Program (ERP). The ERP specifically and strongly underlies to see the effects of the reform program on poverty and building the analytical capacity of the government to monitor and evaluate such effects. To this end, the government has established a Welfare Monitoring System in 1995 to oversight the following major activities:

- Establish an information system that provides a continuous picture of the poverty scenario in the country;
- Indicate the impact of reform programs on the level of household welfare;
- Establish follow-up procedures on the various programs and activities targeted towards poverty reduction and
- Conduct regular statistical surveys to assess, in particular, the efficiency of targeted programs.

CSA and Welfare Monitoring Unit (WMU) of National Planning Commission (NPC) have been the key actors in the M&E system in place by way of producing, analyzing and disseminating poverty related data and results. This effort has been assisted by the development assistance Group (DAG) since the establishment of the above-mentioned M &E system. In line with strengthening the established M&E system of the government, CSA and WMU of NPC had submitted a financial requirement proposal (entitled: Strengthening Data Collection, Analysis and Dissemination on Poverty Monitoring and the MDGs) to the Development Assistant Group (DAG). Following the signing of the Memorandum of Understanding (MOU) between NPC, CSA and the donors, various implementation activities have also been carried out. In addition to the support obtained from DAG, the 2015/16 survey was also supported by WFP (in providing data collection tablet) & UNICEF (in providing iodine test kit).

In order to meet the data needs of the Welfare Monitoring System, CSA has been conducting Household Consumption and Expenditure Survey (HCES) and Welfare Monitoring Survey (WMS) since 1995/96. HCES and WMS surveys provide crucially useful and poverty related information for the designing and monitoring and evaluation of the country's poverty reduction strategy, Sustainable Development and Poverty Reduction Program (SDPRP), various socioeconomic policies and programs and hence monitor the progress towards meeting the Millennium Development Goals (MDGs). The two surveys are inseparable and provide basic data that reflect the standard of living of households, individuals and the society as a whole.

HCES basically provides data on consumption and expenditure of households that reflect the income dimension of poverty while WMS aims at providing socioeconomic data that reflects the non-income dimension of poverty. WMS provides basic indicators on the various socioeconomic areas including health, education, access to and utilization and satisfaction of basic facilities/services and related non-income aspects of poverty.

WMS has been conducted together with HCES in 1995/96, 1999/2000 and 2004/05 and has also been carried out alone in 1997 and 1998. Several reports have been produced based on the previous surveys including the statistical reports produced by CSA. These are reports on the 1995/96 HICES and WMS, report on the 1999/2000 HICES and WMS, summary reports for the 1999/2000 HICES and WMS and report on the 1998 WMS survey as well as the two in-depth analytical reports on poverty situation of the country produced by Ministry of Finance and Economic Development. Unlike the previous surveys (2004/05 & 2010/11), the 2015/16 survey include the nutritional status of a children aged 3-59 months.

This report shows detailed statistical tables at country and regional levels compiled for rural and urban areas. This statistical report is divided in to two chapters. The first chapter covers introduction to the survey, where the overview and objectives of the survey, fieldwork and supervision, training of field staff, field organization, data collection, supervision and data processing activities are discussed briefly. In the second chapter, the survey methodology namely: coverage, concepts and definitions, sampling frame, sample design, sample size and selection scheme was noted. Furthermore, estimation procedures of total, ratio and sampling errors, standard errors and CVs of selected variables, coverage of the survey and the questionnaire in English version are presented in annex I, II, III and IV respectively.

The 2015/16 WMS statistical reports at country, rural and urban levels are presented on two separate volumes. In this report (Volume II) Access to selected Facilities housing, status of housing Facilities and tenure possession of household assets' and selected indicators on food security, shocks and general living standard were presented. Furthermore, additional statistical tables that show data at country, rural, urban and major urban centers level are provided in a CD for references.

1.2 Objectives of the Welfare Monitoring Survey

The main objective of the Welfare Monitoring Survey is to provide data that enable to understand the non-income aspects of poverty and has the following specific objectives:

- to assess the level, extent and distribution of non-income poverty;
- to assess the quality of life of households/individuals;
- to provide basic data that enables design, monitor and evaluate the impact of socioeconomic policies and programs on household's /individual's living standard;
- provide basic indicators on household's and individual's living standard with respect to basic needs including
 - ✓ Education, Health, Child nutrition, Child care and breast feeding, access to and utilization of basic facilities, Housing and housing amenities (drinking water, sanitation, energy, etc.), Household assets, selected indicators of living standard (Shocks and coping mechanisms, Food security, etc.), harmful traditional practices and basic population characteristics.

1.3 Training, Organization of the Fieldwork, Data Collection and Supervision

Training of Field staff

Unlike the previous WMS surveys, in the 2015/16 survey the training was carried out in one phase by bringing all actors of the actual work, i.e.; all enumerators, field editors/supervisors and coordinators in one training center from 29 May to 4 July 2015. Accommodation was arranged for trainees as well as trainers at the center in Addis Ababa.

Training of the WMS was given by 10 subject matter experts for about 10 days with four class rooms. All together (HCES & WMS) About 267 enumerators, 89 team leaders or, field editors/supervisors, 25 statisticians from branch offices, 12 statisticians from the directorate and 2 statistical technicians from the head office were participated in the training. The training had, basically, three sessions. Theoretical session, panel group discussion session and a two days field practice session. The panel discussion session has been conducted in the evening just after dinner, usually 8:00 to 10:00 PM, every day excluding Sunday.

The theoretical training was focusing on theoretical discussions on concepts, definitions, and principles of interview and how to complete questionnaires. The training had also focused on practical sessions which include mock interviews and a two day field practice in selected enumeration area around the training center. The objectives of practical interviewing of households were two fold. First, it enabled to assess how well the theoretical class discussions were understood by all participants. The second objective was to examine the practical difficulties pertaining to the various socioeconomic groups, which would likely be encountered during the actual fieldwork. In general, the training was more detailed in both theoretical and practical aspects to ensure the full competence of the field staff in collecting the required data by paper questionnaire and electronic copy using computer assisted personal interview (CAPI).

Field Organization, Data Collection and Supervision

The branch offices mainly led by the Household Surveys and Price Statistics Directorate did the major work of the field organization. All the 25 branch offices of the CSA had fully participated in the survey undertaking, starting from recruitment/selection of field staff, in deploying the field staff to their respective sites of assignment, field supervision and retrieval of the completed questionnaires in the form of hard and soft copy to the head office where the data processing activities take place. The branch offices were also responsible for administering financial and logistics aspects of the survey. Additionally, line government organizations especially Kebele's had also a significant role in facilitating the fieldwork. Writing administrative letters introducing the work, enumerators and field editors to the local people particularly the sampled households, provision of field guides, etc were tasks of the local government units.

Welfare Monitoring Survey data collection has taken place from 8 July 2015 to 7 July 2016. All together a total of 267 enumerators and 89 supervisors/ field editors with an average supervisor-enumerator ratio of 1 to 3, 25 heads of branch offices and 25 statisticians were involved in the field work. To undertake the fieldwork, depending on the availability and the situation, four-wheel-drive vehicles and the public transportations were used to deploy the working team all over the branch offices.

Interview method was basically used to collect data on population characteristics, education, health, household based modules such as accessibility of facilities, household amenities, etc. On the other hand, an Objective measurement method was used to collect anthropometric data like height and weight of children aged 3-59 months. In addition, whether the salt consumed by sampled households was iodized or not was examined objectively using the iodine test kit.

The 2015/16 WMS data, unlike the previous WM surveys was collected side by side with HCES for one full year in order to avoid any inconsistency of data between the two surveys, that could be observed due to differences in data collection period, In addition the 2015/16 WMS/HCES surveys data collection was carried out using electronic device CAPI (Computer Assisted Personal Interview).

Survey Instruments\ questionnaire.

Including the cover page a total of 14 pages (A3 size paper) questionnaire was prepared for the survey to collect data from selected households. The content of the questionnaire was divided in to nine sections.

Section 1: Demographic Characteristics and Economic Activity: In the first section of this questionnaire, demographic characteristics of the household members such as relationship to the head of household, sex, age, disability status and religion were asked from all members of the household. The second part of this questionnaire deals with the current economic activities of the household members aged 10 years and above. Furthermore, this section also deals, whether a person is engaged in productive activity during the last seven days prior to the date of interview. In this part of the questionnaire, if the person is not engaged in any of productive activity, during the last seven days, the main reason for not engaging in productive activity was also asked. Moreover, the employment status, the occupation and industry for the main jobs were also collected from persons that were engaged in the economic activity or from those who were absent from work/temporarily lay off for that week. In addition, data on marital status was also captured from those members whose age are greater or equal to ten years old.

Section 2: **Education:** It consists among others, school attendance, dropout, reason for dropout, and literacy status were asked from all members of the household aged 5 years and above.

Section 3: Health: In the first part of this questionnaire (from question 3103-3118), health conditions of all members of the household during the last two months were collected. While, In the second parts i.e. (from question 3119-3130), health information of the last 12 months was also collected to all members of the household.

Section4: Nutritional status, Child Care and Breast Feeding: Data on birth history and breast feeding of children under age of five years were collected throughout the year. After a long time of WMS, in the current survey, weight and height of a children aged 3-59 month were also studied.

Section5: Housing Standard and Amenities: In this section, the selected households were asked about their housing and kitchen standard, sanitation, source of drinking water, fuel and power facilities at the time of the survey, 12 months and 5 years before the survey. And information on ability of consuming iodize salt during the survey period was collected.

Section 6: Household's Living Condition Indicators: Consists of four main sections namely; food security indicators, status of crop production, main source of income and coping strategy of the household.

Section 7: Access, Utilization and Satisfaction of Basic Facilities/Services: This form is used to collect data from the households like distance to service facilities and extent of utilization of the facilities, reason for not using the closest service facility and question on access, utilization and satisfaction of basic facilities.

Section 8: Land and Dwellings Ownership Status, utilization of Land and Other: This section was administered at household level and consists of four main sections namely: dwelling and land ownership status, utilization of land not owned by the household and about fixed assets owned by the household.

Section 9: Harmful traditional practice: This form is used to collect data for children aged 0-14 years about their harmful traditional practice such as, circumcision, cut of his/ her uvula and for ages less than two years particularly about milk teeth

In the process of data collection, a two-time supervision, which also is compulsory activity in CSA surveys, was undertaken at various levels to ensure the quality of the data. The permanent field supervisors/ field editors were assigned to take care of the day-to-day supervision activities. Branch office statisticians and heads of the branch offices were also involved in a regular supervision. Most of the professionals that were engaged in the training of the field staff were also involved on the actual field supervision.

1.4 Data Processing

The data processing activities were undertaken at the branch office particularly in the enumeration areas where the WMS data was collected. The first stage of data processing activity was training of field editors/supervisor which was held at the head office by subject matter Directorate staffs. The training was given in Addis Ababa during the time of field staff training. About 89 field editors/supervisors were engaged in the manual editing and coding activities which lasted for about 13 days. Side by side data collection and entry also took about 13 days using CAPI.

The new additional variables appeared during the data collection were inserted to the existing questionnaire were thoroughly done by the expert of the directorate. The difficult part is checking the consistency of the demographic part of both WMS & HCES .Machine data cleaning, estimation with proper sampling weights and tabulation activities were carried out procedurally by the professional staff from the Household Survey and Price Statistics Directorate at the head office. The Integrated Microcomputer Processing System (IMPS) complemented by CSPRO software were used for data entry, consistency checks and tabulation of survey results.

Table1: Distribution of 2015/16 WMS & HECS sample EAs by branch office, rural & urban.

CHAPTER II SURVEY METHODOLOGY

2.1 Coverage

The year 2015/16 Welfare Monitoring Survey covered all rural and urban parts of the country. The 2015/16 survey, unlike the previous WM surveys fully covered both the sedentary as well as the pastoralist areas of Somali and Afar regions. In the rural part of the country it was planned to cover 864 enumeration areas (EAs) and 10,368 households (12 households per EA). Whereas for the urban areas, it was planned to cover 1,242 enumeration areas (EAs) and 19,872 households (16 households per EA).

The response rate of the 2015/16 WMS was very high than ever. All the rural sampled EAs and households were fully covered by the survey. Similarly, in urban areas all EAs were fully covered by the survey. However, with respect to households, out of the 19,872 sample households, only 3 households were not covered by the survey, which gives a total response rate of 99.99%. At the end, it was possible to obtain complete and cleaned raw data set from 30,237 households, which is quite high compared to the 2010/11 WM survey.

2.2 Concepts and Definitions

HOUSEHOLD SURVEY: Household survey is a method of data collection using interviewer/enumerators with designated households as to obtain and record responses (with application of practical measurement if necessary) to a specific list of questions and/or area of interest. A survey differs from a census in that only a sample of households is covered

<u>URBAN CENTER:</u> in principle is defined as a locality with 2000 or more inhabitants. In this survey, however, for practical purposes an urban centre includes the following regardless of the number of inhabitants.

- i) All administrative capitals (Regional capitals, Zone and Wereda capitals),
- ii) Residential areas with Urban Dweller's kebeles (UDKs) not included in (i),
- iii) All localities which are not included either in (i) or (ii) above having a population of 1000 or more persons, and whose inhabitants are primarily engaged in non-agricultural activities.

<u>URBAN KEBELE</u>, (UK): is the lowest administrative unit in an urban centre with its own jurisdiction. It is a locality (commonly known as Kebele) formed by the inhabitants, and usually constitutes a part of the urban centre.

<u>RURAL KEBELE (RK)</u>: is the lowest administrative unit in a settled rural area with its own jurisdiction. It is an association of rural dwellers formed by the inhabitants of a given area whose members are engaged either in agricultural and/or non-agricultural activities.

ENUMERATION AREA (EA): is a unit of land delineated for the purpose of enumeration housing units and population without omission and duplication. An EA usually consists of 150 to 200 households in rural areas and 150 to 200 housing units in urban areas. An enumeration area should be related to a UK or a RK in one of the following ways.

- An EA may be equal to a RK if the number of the households in the RK is less than
 or equal to 150 200 in rural areas; and is equal to a UK in urban areas if the number
 of housing units in the UK is 150 200.
- An EA may be a part of a RK or a UK and its delineation cannot extend outside the boundary of the corresponding RK or a UK.

<u>COLLECTIVE QUARTER</u>: A collective quarter is a premise (a housing unit, a building or a compound) in which a number of unrelated persons reside together, and share common facilities.

Examples of collective quarters are monasteries, prisons, boarding schools, home for aged, children's homes, work camps, military barracks, etc. It is important to note that in the premises of some collective quarters, there may be private households.

<u>HOUSEHOLD</u>: Constitutes of a person or group of persons, irrespective of weather related or not who normally live together in the same housing unit or group of housing units and who have common cooking arrangements.

<u>HEAD OF HOUSEHOLD</u>: A head of a household is a person who economically supports or manages the household or for reasons of age or respect, is considered as head by members of the household or declares himself as head of a household. Head of a household could be male or female.

<u>MEMBER OF HOUSEHOLD</u>: Person constituting a household is called member of the household. The following are considered as members of a household:

- i) All persons who lived and ate with the household for at least six months including those who were not within the household at the time of the survey and were expected to be absent from the household for less than six months.
- ii) All guests and visitors who ate and stayed with the household for six months and more.
- iii) House maids, guards, baby-sitters, etc. who lived and ate with the household even for less than six months.

HOUSEHOLD SIZE: Is the total number of members of a household.

GROSS ENROLLMENT RATIO: is the total enrolment in a given level of school, regardless of age, per 100 children of that school age. For example, the gross enrolment ratio for primary level is defined as a quotient of the total number of pupils in grades 1–6 and the total population aged 7-12 years expressed as percentages.

<u>SCHOOL DROPOUT</u>: A person is considered to be a school dropout if he/she did not appear for the end of year examination or took the examination but did not register the following academic year.

AGE GRADE MISMATCH: is a measure of the age-grade slippage which gives the proportion /number of enrolled persons that are out of school age specified for each level of school (7-12 years for primary and 13-18 years for secondary).

<u>FACILITIES AND AMENITIES</u>: These are basic infrastructures such as food, markets, post office, telephone, school, health, drinking water and transport services etc.

<u>PRODUCTIVE ACTIVITY:</u> This is an act of selling (making available to the market) the output of an activity (the whole or in part) in kind or in cash: This includes, but is not limited to, working at an enterprise (public or private) for salary/wages. Here too, all activities that are carried out in rural areas by private peasant agricultural holders are considered to be productive.

<u>EMPLOYER</u>: is a person who hires at least one employee for her/his enterprise/establishment or activity. Anyone who uses hired labour for her/his activity and takes part in the productive activity is considered an employer.

<u>EMPLOYEE</u>: An employee is any worker hired by someone on contract, permanent or temporary basis. The payment could be in cash or kind on weekly, bimonthly or monthly basis.

<u>SELF EMPLOYED</u>: This is an individual who works in his own enterprise including agriculture without hiring any labour. For the purpose of this survey, those who use in this survey those who use family labour without payment also are considered self-employed.

<u>UNPAID FAMILY WORKER:</u> A member of a household who is working for the enterprise/establishment or activity of the household without payment.

ANTHROPOMETTRY: The technique that deals with the measurement of the size, weight and proportions of human body.

ACUTE MALNUTRITION OR WASTING: is a condition of low weight-for-height. Wasting is nutritionally deficient state of recent onset related to sudden food deprivation or malabsorption or poor utilization of nutrients, which results in rapid weight loss.

CHRONIC MALNUTRITION OR STUNTING: is a condition of low height-for-age. Stunting is a nutritional deficient state of long-term food deficiency often combined with persistent ill health.

UNDER WEIGHT: A condition of low weight-for-age. It is a composite index of malnutrition (either acute or chronic malnutrition) based on the principal that a child has an expected weight for that child's age.

Z-SCORE: A statistical measure of the distance, in standard deviation (SD) units, of a value from the mean.

<u>Z-SCORE</u>: A statistical measure of the distance, in standard deviation (SD) units, of a value from the mean.

2.3 Sampling Frame

The list of all households obtained from the 2007 Population and Housing Census was used as a frame to select the sample EAs in the rural and urban areas of the country. The frame from which sample households were selected was based on a fresh list of households taken at the beginning of the survey period in each of the selected EAs.

2.4 Sample Design

For the purpose of representative sample selection, the country was divided into four broad categories including rural category, major urban centers category, and medium and small size town's category.

Category I - Rural: - The rural areas of eight regions as well as the rural part of both Harari region and Dire Dawa City Administration are included in this category. The rural part of each region was considered to be a survey domain (i.e. reporting level) for which the major findings

of the survey are reported. Accordingly, a total of 10 survey domains was formed under this category. There was no domain in this category for Addis Ababa City Administration because the region doesn't have the rural part. A stratified two stage cluster sample design was adopted to select EAs and HHs, where enumeration areas are the primary sampling units (PSUs) and the secondary sampling units (SSUs) are households.

Category II - Major urban centers: - In this category all regional capitals (10 cities), eleven other major urban centers that have relatively larger population size as well as 10 sub cities of Addis Ababa (totally 31 urban centers)were included. The survey was designed to provide an estimate for each and every urban centers included under this category. In this category too, a stratified two stage cluster sample design was adopted to select sample EAs and HHs, where enumeration areas are the primary sampling units (PSUs) and the secondary sampling units (SSUs) are households.

Category III & IV - Other urban centers: - Urban centers in the country, other than those under category II, were grouped under category III & IV. A domain of other urban centers was formed for eight regions. There is no domain in category III & IV for Harari, Addis Ababa and Dire Dawa Administration as they do not have urban centers other than those grouped under category II. Unlike the above two categories, a stratified three stage cluster sample design was adopted to select Sample Towns, EAs & HHs. In this case the primary sampling units were towns, whereas, enumeration areas and households were the secondary & the third stage sampling units respectively.

2.5 Sample Size and Selection Scheme

Category I: - A total of 864 EAs and 10368 households were selected from this category. Sample EAs of each reporting level were selected using Probability Proportional to Size (PPS) techniques; size being number of households obtained from the 2007 Population and Housing Census. Twelve households per EA were systematically selected from a fresh list of households prepared at the beginning of the survey.

Category II: - In this category 744 EAs and 11,904 households were selected. Sample EAs from each reporting level in this category were also selected using PPS techniques; size being number

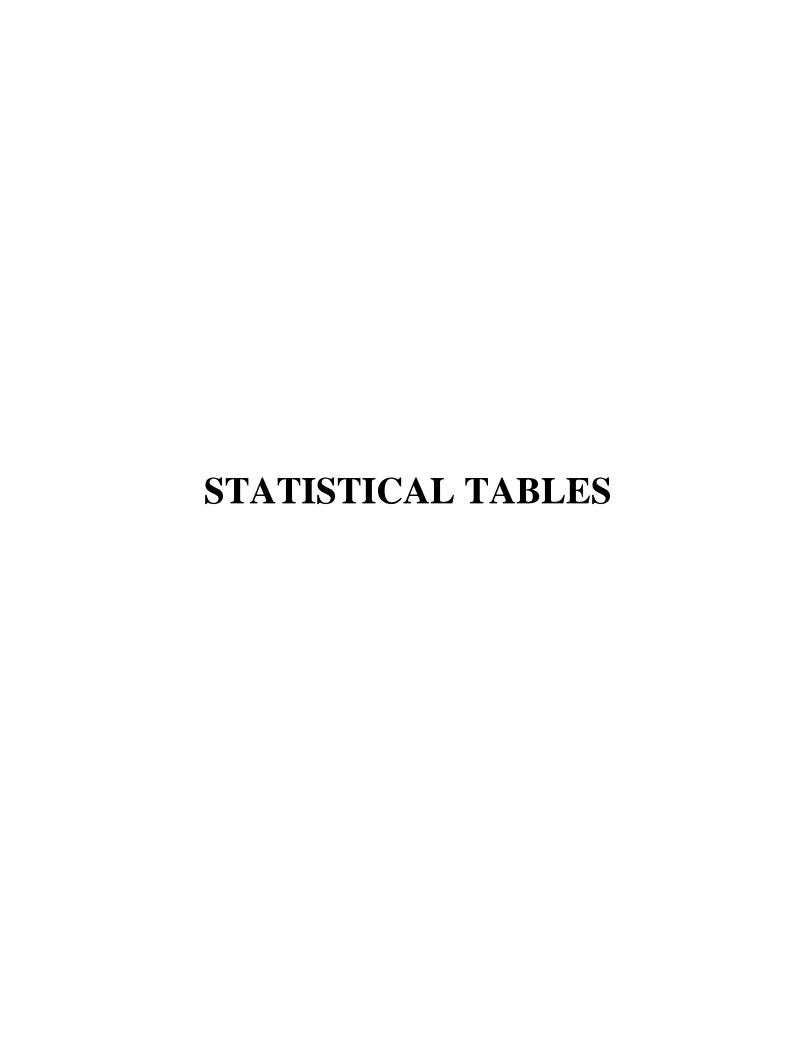

of households (Census 2007). Sixteen households in each of the selected EAs were systematically selected from a fresh list of households prepared at the beginning of the survey.

Category III & IV: - One hundred seven urban centers, 498 EAs and 7,968 households were selected in these two categories. Urban centers from each domain as well as EAs in each urban center were selected systematically using the PPS techniques; size being number of households (Census 2007). Sixteen households in each of the selected EAs were systematically selected from a fresh list of households prepared at the beginning of the survey.

Table2: Domain Allocation of 2015/16 WMS Sample EAs & HHS.

ANNEX I ESTIMATION PROCEDURES OF TOTAL, RATIO AND SAMPLING ERROR

ANNEX I: Estimation Procedures of Total, Ratio and Sampling Errors

The following formulas were used to estimate the required variables by reporting levels.

1. Estimate of Total \hat{Y}_h in Rural Domain (Category I)

$$\hat{Y}_{h} = \sum_{i=1}^{n_{h}} \frac{M_{h} H_{hi}}{n_{h} M_{hi} h_{hi}} \sum_{J=1}^{h_{hi}} Y_{hij} = \sum_{i=1}^{n_{h}} \sum_{j=1}^{h_{hi}} W_{hi} Y_{hij} - \dots$$
 (1)

Where,

$$W_{hi} = \frac{M_h H_{hi}}{n_h M_{hi} h_{hi}}$$
 is the basic sampling weight

2. Estimate of Total \hat{Y}_h in Major Urban Domain (Category II)

$$\hat{Y}_{h} = \sum_{a=1}^{3} \sum_{i=1}^{n_{aih}} \sum_{j=1}^{h_{hai}} W_{hai} Y_{haij} \qquad (2)$$

Where,

$$W_{hai} = \frac{M_{ha}H_{hai}}{n_{ha}M_{hai}h_{hai}}$$
 is the basic sampling weight

3. Estimate of Total \hat{Y}_h in Other Urban Domain (Category III)

$$\hat{Y}_{h} = \sum_{i=1}^{n_{h}} \frac{M_{h}}{n_{h} n_{hi}} \sum_{j=1}^{n_{hi}} \frac{H_{hij}}{M_{hij} h_{hij}} \sum_{k=1}^{h_{hij}} Y_{hijk} \qquad (3)$$

$$= \sum_{i=1}^{n_{h}} \sum_{j=1}^{n_{hi}} \sum_{k=1}^{h_{hij}} W_{hij} Y_{hijk}$$

Where,

$$W_{hij} = \frac{M_h H_{ij}}{n_h n_{hi} M_{hij} h_{hij}}$$
 is basic sampling weight

The following notations were used in the formula:

- $M_h = \text{Total number of households in stratum h obtained from the sampling frame.}$
- M_{hi} = Total number of households in EA/PSU i for rural and urban domain or in urban center/PSU i for other urban domain, stratum h obtained from the sampling frame.
 - n_{k} = Number of successfully covered sample EAs for rural domain in stratum h.
- H_{hi} = Total number of households obtained from the survey listing in sample EA/PSU i stratum h for rural domains.
- h_{hi} = Total number of households successfully covered in EA/PSU i stratum h for rural domain.
- M_{ha} = Total adjusted number of households of the domain in substrata a and stratum h obtained from the sampling frame
- H_{hai} = Total number of households obtained from the survey listing in EA/PSU i of substratum a and stratum h
- $n_{ha}= {
 m Number}$ of successfully covered sample EAs/PSUs for major urban domain in substratum a and stratum h
- M_{hai} = Total number of households in EA/PSUi in substratum a and stratum hobtained from the sampling frame
- h_{hai} = Total number of sampled and covered households in sampled EA/PSU I substratum a and stratum h
- \hat{Y}_{haij} = The observed value of characteristic y for household j, in EA/PSUi, substratum a and stratum h of Major Urban Domain
- M_{hij} = Total number of households in EA/SSU j, urban centers/PSU i and stratum h obtained from the sampling frame for other urban center domain.
- n_{hi} = Number of sample EAs successfully covered in urban center/PSU i and stratum h for other urban center domain.
- H_{hij} = Total number of households obtained from the survey listing in EA/SSU j, urban center/PSU i and stratum h for other urban center domain

 h_{hij} = Number of sample households successfully covered in EA /SSU j, urban center/PSU i and stratum h for other urban center domain.

 Y_{hij} = The observed value of a characteristic y for household j in sampled EA/PSU i and stratum h for rural domain.

 Y_{hijk} = The observed value of a characteristic y for household k in EA/SSUj, urban center/PSU i and stratum h for other urban domain.

Note: Estimate of total at country level, \hat{Y} , is obtained by summing up stratum/domain total estimates.

$$\hat{Y} = \sum_{h=1} \hat{Y}_h$$

4. Sampling Variance of the Estimates:

Sampling variance of estimate of stratum total are given by the following formulas:

The variance of domain or reporting total estimate is:

$$V(\hat{Y}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{Y}_{hi}^2 - \frac{\hat{Y}_h^2}{n_h} \right] - \dots$$
 (4)

in which $\hat{Y}_{hi} = W_{hi} \sum_{i=1}^{h_{hi}} Y_{hij}$ for rural and major urban centers domains,

and
$$\hat{Y}_{hi} = \sum_{i=1}^{n_{hi}} W_{hij} \sum_{k=1}^{h_{hij}} y_{hijk}$$
 for other urban center domain.

$$V(\hat{Y}) = \sum_{h} V(\hat{Y}_h) - \dots$$
 (5)

$$SE(\hat{Y}_h) = \sqrt{Var(\hat{Y}_h)} - \dots$$
 (6)

5. Coefficient of Variation (CV) and Confidence Interval (CI)

The following formulas were used to calculate CV and CI of the domain (reporting level) total. The coefficient of variation (CV) of domain total in percentage is:

$$CV\left(\hat{Y}_{h}\right) = \frac{\sqrt{VAR(\hat{Y})}}{\hat{Y}} *100 \qquad (7)$$

And ninety-five percent confidence interval (CI) of domain total:

$$\hat{Y}_h \pm 1.96 * SE(\hat{Y}_h)$$
 ------(8)

6. Ratio Estimates:

$$\hat{R}_h = \frac{\hat{Y}_h}{\hat{X}_h} \text{ and } \hat{R} = \frac{\hat{Y}}{\hat{X}} \qquad (9)$$

Where, the numerator and the denominator are estimates of domain totals of characteristic y and x, respectively.

$$Var\left(\hat{R}_{h}\right) = \frac{1}{\hat{X}_{h}^{2}} \left[Var\left(\hat{Y}_{h}\right) + \hat{R}_{h}^{2} Var\left(\hat{X}_{h}\right) - 2\hat{R}_{h} Cov\left(\hat{Y}_{h}, \hat{X}_{h}\right) \right] - \cdots (10)$$

In which

$$Cov(\hat{Y}_{h}, \hat{X}_{h}) = \frac{n_{h}}{n_{h} - 1} \left[\sum_{i=1}^{n_{h}} \hat{Y}_{hi} \hat{X}_{hi} - \frac{\hat{Y}_{h} X_{h}}{n_{h}} \right] - \dots$$
 (11)

Estimates of standard error, coefficient of variation and confidence interval for the ratio estimate can be calculated by adopting formulas 6, 7 and 8.

ANNEX II STANDARD ERRORS AND COEFFICIENTS OF VARIATION OF SELECTED VARIABLES
